

# Congratulations!

We look forward to assisting you with your self-care regimen!

## Cryoprobe

### PRE-TREATMENT

- There are no instructions, restrictions or specific products you need to avoid prior to this treatment.

### POST-TREATMENT

- Lesions will start to either blister or darken around day 5 post treatment, followed by a scab.
- The lesion will fall off between days 10-14.
- You might need a second treatment for complete removal of lesion.

DO NOT pick the scab or any of the skin - this will end up scarring.

Do not rub the area roughly.

You can place a bandaid on it, but this is not required.
